

ABSTRACT

A vibration absorbing grip including a grip body formed by a multi-layer material. The material preferably includes a first elastomeric layer of vibration absorbing material which is substantially free of voids therein. A second elastomeric layer which includes an aramid material therein and is disposed on the first elastomeric layer. The aramid material distributes vibration to facilitate vibration dampening. A third elastomeric layer is disposed on the second elastomeric layer and is adapted to be gripped by a user.
